

Care-SIMS — End-to-End Demo Flow

Organization creation through to collecting payment. Every login and behaviour below was verified against the live system.

App `care-sims.vercel.app` · Demo org `Sims Box` · Password for every account `Demo@1234`

Logins

ROLE	EMAIL	DOES WHAT
Platform admin	<code>in backend/.env</code>	Creates the organization
Org admin	<code>admin@simsbox.demo</code>	Locations, departments, staff, features, audit
Reception	<code>reception@simsbox.demo</code>	Registers the patient and starts the queue
Nurse	<code>nurse@simsbox.demo</code>	Triage, vitals, medication administration
Doctor	<code>doctor@simsbox.demo</code>	Consults, prescribes, orders labs, refers
Lab technician	<code>lab@simsbox.demo</code>	Sample, results, validation
Pharmacist	<code>pharmacy@simsbox.demo</code>	Dispenses against the prescription
Billing	<code>billing@simsbox.demo</code>	Finalises the invoice, collects payment
Patient	<code>patient@simsbox.demo</code>	Own timeline, prescriptions and bills

Everyone signs in on the same `/login` page. It auto-detects staff, then platform, then doctor — so the doctor works there too even though she is a registry record rather than a staff account. The patient uses `/patient/login` and then picks the hospital.

Part 1 · Create and configure the hospital

01 Register the organization

Platform admin

1. Organizations → **Register Organization**. Four steps: Organization Details → Location & Contact → Subscription & Features → Review & Register.
2. **Next** stays disabled until a legal name is entered. Step 3 offers 52 feature toggles.
3. Registering provisions one org-admin user, one location and 36 enabled features.

The org admin is created last inside the same request. Wait until the org's user list is non-empty before resetting demo passwords, or the admin keeps a random temporary one.

02 Put a doctor on the registry

Platform admin

1. **Register** the doctor, **Verify** them, **Affiliate** them to the organization and a location, then set a **schedule**.
2. The registry lists doctors with VERIFIED / PENDING status and filter tabs for All · Pending · Verified · Rejected · Suspended.

The registry is global across every organization. Entries are archived rather than deleted, because prescriptions, lab orders, referrals and OT bookings reference the doctor by id.

03 Locations, departments, staff

admin@simsbox.demo

1. **Locations** — Sims Box runs two: Main Campus (where stock lives) and Branch Clinic.
2. **Departments** — General Medicine, Pediatrics, Pharmacy, Laboratory, Emergency. A department needs only a name and code.
3. **Users & Staff** → **Add User** — name, email, role, primary location and departments. Departments are what scope a nurse's triage queue.

Part 2 · The patient journey

04 Register the patient

Reception

1. **Register Patient** → demographics, then visit details: chief complaint, preferred doctor, department.
2. Press ✓ **Register Patient & Generate Token**. This saves *and* queues in one action — the row shows **Awaiting triage** with a token number.

| There is no separate send-to-triage step. The row's Triage button is greyed out with "Already in today's workflow".

05 Triage

Nurse

1. **Triage** lists patients waiting, filtered to the nurse's own departments.
2. Pick an acuity: **Emergency · Critical · Urgent · Semi-Urgent · Routine**.
3. Record vitals — BP Systolic and Diastolic are separate fields, plus Heart Rate, Temp, SpO₂, Respiratory Rate, Weight, Height, Pain.
4. **Complete Triage & Assign Doctor**.

| Acuity drives the queue: choosing Urgent flips the patient's queue token to URGENT so they sort ahead of earlier arrivals.

06 Consultation

Doctor

1. **My Queue** → patient → tabs Overview · SOAP Notes · Orders · History.
2. **Lab Order** on the Orders tab: priority, test name, category, urgency, clinical notes → **Place Lab Order**.
3. **Refer** beside the patient's name opens the referral form with them already selected — Internal or External, department or free-text facility, destination site, diagnosis, urgency.
4. **Write Prescription**: pick each drug *from the catalog* and set dosage, frequency, route, days and **Qty**, then **Send to Pharmacy**.

| Picking from the catalog is what lets the pharmacy match stock and price the line. Qty is required — without it the pharmacy has nothing to count out.

07 Laboratory

Lab technician

1. The worklist names the ordering doctor on every row.
2. ORDERED → Mark Collected → SAMPLE COLLECTED → Start Processing → IN PROGRESS → Enter Results → RESULTED → ✓ Validate → VALIDATED
3. **Enter Results** opens a row per test: Result (required), Unit, Reference Range, Flag, Remarks → **Submit Results**.
4. Once validated the row offers **Print Report**.

08 Pharmacy — dispense

Pharmacist

1. The queue shows the prescription number, prescribing doctor and a live stock badge per drug.
2. Select the prescription, review medications and total, add Pharmacist Notes, then **Dispense Medications**.

| The strongest thing to demo: stock is allocated first-expiry-first-out and really drops — dispensing 4 of a 200 batch leaves 196. Anything the pharmacy cannot account for comes back as a named shortfall rather than a false success. The pharmacist's note is appended to the doctor's, never overwriting it.

09 Ward medication record — optional

Nurse

1. **Medication Admin** → **Schedule Medication**, search the admission, then pick from that patient's prescribed drugs.
2. Drug, dose, route and frequency fill themselves and the dose is linked to the prescription it came from.

Dispensing deliberately does not auto-create these rows — choosing an administration time is the nurse's call.

10 Billing

Billing

1. Consultation, lab and pharmacy charges have already rolled onto the patient's open visit invoice.
2. Search by invoice number or patient name, open the invoice, **Finalize**, then **Collect Payment**.

Worth demonstrating: type more than the balance. It is refused with the exact outstanding figure, on the server as well as in the browser. The tiles are true tenant-wide figures — Collected Today means today.

11 Patient portal

Patient

1. Sign in, **Choose Your Hospital** → Sims Box → Continue.
2. **Timeline** shows the whole visit in order: appointment, triage, consultation, prescription, lab order, lab result, referral, invoice, payment, admission.
3. Prescriptions filter by Dispensed; Lab Reports, Billing and Vitals History alongside.

Declined and cancelled referrals are withheld here on purpose — the portal shows a patient their care, not internal churn.

Before you present

Wake the backend first. It sleeps when idle and a cold start can exceed the app's own 30-second timeout, which looks exactly like a failed login. Load any page once and wait before you begin.

- **Skeletons, not empty tables.** Grey placeholder bars are the loading state — give lists a moment.
- **Search boxes are debounced.** Patient, drug, department and admission pickers fetch as you type; wait for the name before clicking.
- **Doctors order labs from the consultation**, not the Lab Orders menu — that opens the laboratory's own processing screen.
- **Stock lives at Main Campus** while the pharmacist's account sits at Branch Clinic. Stock figures are org-wide on purpose.

Password for every account listed is Demo@1234 · Platform admin credentials live in backend/.env, not in this document.
